

Experience in GPSBRIANZA TEAM

To start [Erasmus for young entrepreneurs](#) program we decide to insert all the previous feedback also in english, so anyone could understand them.

In the past we welcomes in our working group a lot of young students and graduates, facilitating their entry into the world of work, so different from the school one, involving them for different projects and growing their skills within a professional group but at the same time familiar.

Here is their opinion about the time they spent with us:

■ "I met Giorgio and his father Luca after finishing my engineering degree in 2012. I met them after a trivial search on Google following my university thesis on GPS. I took a little test and then I've been involved in the very first project together: 280km trekking and MTB trails' GPS survey and GIS elaboration in Sila area (Calabria, in the South of Italy). After that, I get my own partita IVA (VAT number) and started a precious collaboration with Giorgio and Luca, during which I learned so many things like energy practises, technical drawing and more, mostly a solid method of work . It's a professional study, but also familiar, thanks to I get the opportunity to grow learning work dynamics and how to approach to different subjects like public administrations or privates, managing to make my contribution continuously to the growth of GPSBRIANZA. During last years I developed my GPS and GIS skills in parallel, thanks to projects carried out together, the Lariano Triangle and the Gran Sasso and Monti della Laga National Park to mention the most important in the GPS field, or the provision of different courses at the Polytechnic of Milan, public bodies and professional orders, but also many other jobs in the most disparate sectors that have allowed me to develop my skills and my ability as a freelancer, also cementing a fruitful collaboration that continues today."

Marco T.

■ I met Giorgio and Marco as external experts in GIS systems during my attendance at the Territorial Planning course at the Politecnico di Milano. Immediately, in addition to the professionalism shown in presenting the topics, I was impressed by their enthusiasm and the passion with which they described their activity as engineers. Intrigued by the GIS systems, I decided to undertake internship with the GPS Brianza team, which then became an opportunity for working collaboration. They inserted me into the regional project "Implementation of the Lombardy Region Land Registry" (as validator for GPS tracks and relative database transmitted by local authorities) on behalf of the team. The peculiarity of GPS Brianza is the harmony among all the team members in finding solutions together, so that they can face the engineering challenges in an interdisciplinary and stimulating environment. I was thus able to be involved in GIS projects concerning the pathways, PGT, digital cartography, cadastral, building and energy efficiency issues. These are all challenges that require methodologies and rhythms not yet developed by a student, so they let you enter with a "full immersion" approach into the real life of engineering profession. An educational and stimulating experience that I highly recommend.

Giuseppe C.

I had the opportunity to collaborate with GPS Brianza studio during all 2018 to develop my professional skills in parallel with my university studies. I found myself very well with Giorgio, Luca and Marco and I noticed a particular openness towards new projects that also involve trainees and external professionals, thus making the environment very dynamic and stimulating. The experience that I liked most was the basic course of GPS and QGIS, thanks to which I discovered an innovative sector of survey and accurate planning. I also learned how to draw correctly the documents for the municipality, make photomontages and set up a CENED energy certification. In conclusion, I am satisfied with the experience and training received and recommend this study to future interns.

Davide M.

I met GPSBRIANZA team thanks to some lectures about the GIS systems they held during an university course. I was immediately fascinated by the subject, so when the internship time came my choice fell back quickly on the GIS systems and I got in touch with eng. Meroni. He and his team welcomed me making me feel immediately one of them, humanly but above all professionally. This experience taught me a lot: the professionalism and enthusiasm with which all the collaborators of the studio deal with each project, the direct experience of the world of work and in particular how young engineers behave in constant relationship with the customers and the public sector. I strongly recommend this experience to future interns because it gives much more than just learning how to do a job: it teaches teamwork, the added value that each component can bring and the passion you put into doing what you love.

Anna O.

Working together with engineer Meroni and his team was a real honor. I had the great opportunity to work together with professionals who helped me both in personal and professional training. They are competent people and they had the patience to teach me teamwork, the importance of precision and dedication to work, but above all to have fun together. It was really a great experience and opportunity and I am infinitely grateful.

Irene C.

My experience of school-work in the GPSBRIANZA study was definitely positive because I was able to appreciate various aspects of the engineering world, from the building energy efficiency to the GPS use in various sectors (in particular the touristic and urban field). I would have appreciated the stage even more if I had learned something about Termolog software, but I am aware of the limited time I had. Moreover this experience was positive also from a human point of view due to the beautiful relationships that have been created among the members and not only for the high-quality work to be done.

Michele M.

During my stage at GPS Brianza I found myself very well. The studio is a very professional environment but also familiar. All the people are always willing to explain some knowledge if you need some help and they are very organized. Good place to do internships in.

Matteo P.
